

Self-Assessment: United We Stand Website

Where did you create this artifact?

This artifact was during the fall semester of 2013 at the University of Wisconsin – Stout in the Information and Communication Technology 575 Web Production & Distribution. The objective of this project is to learn how to create a wireframe all the way to a functional responsive website for desktop as well as mobile devices.

Explain why you choose to create this artifact.

This artifact was one of the requirements in the Web Production & Distribution course. I chose this particular theme because it allowed me to finish the project within the same semester and yet fulfill all the requirements.

How did you learn this?

This project required a lot learning from JavaScript, CSS3, and HTML5. Many of the time, gathering information from various online sources such as the W3CSchools.com, Lynda.com, and other forums. The sliding images JavaScript were from another site that I implemented into this project.

How will you apply this?

This is applicable to almost every website currently on the Internet. With Google start ranking responsive website, CSS3, HTML3, and JavaScript became very important to creating a dynamic website. The very minimum knowledge a person needs to have to fully create a dynamic website are these three things.

What challenges & obstacles did you overcome?

Some of the most challenging of this project is understanding intricate details of CSS3, HTML5, and JavaScript. I have used in the past but to fully understand what each attributes or tags do was challenging. Although the sliding image JavaScript was already written, implementing and customize to fit my need also posed a certain challenge.
